PROFILE

Software engineer in Melbourne building full-stack applications, distributed file infrastructure and AI workflows. Studying software engineering at Monash University, with experience across healthcare products, enterprise platforms and student technology.

TECHNICAL SKILLS

Application: TypeScript, JavaScript, React, Next.js, React Native, Tailwind CSS, Redux Toolkit

Backend and data: Node.js, NestJS, FastAPI, Python, REST APIs, PostgreSQL, MongoDB, Redis, Prisma, BullMQ

Infrastructure and AI: Docker, GitHub Actions, Railway, AWS EC2, S3, Groq, Hugging Face, Ollama, React Flow

EXPERIENCE

Lead Frontend Developer · WIRED Monash

March 2026 – ongoing

Lead frontend architecture and interface development for Monash University's IT student society. Coordinate contributors, reusable component patterns and release planning to deliver accessible, responsive technology for the student community.

Associate Full-Stack Engineer · PlasmiT Vector

2026

Owned frontend, full-stack and mobile features for healthcare workflows, from requirements and user flows through testing and production readiness. Managed development, staging and production configurations, standardized reusable components, reviewed changes and supported developer onboarding.

Full-Stack Engineering Intern · PlasmiT Vector

March – June 2026

Contributed to healthcare web and mobile experiences, reusable UI components and responsive clinician workflows. Supported feature testing, debugging and iterative refinement across desktop and mobile interfaces.

Software Engineer Intern · LENS Corporation

September – December 2024

Developed modular interfaces for internal enterprise workflows and integrated REST APIs. Contributed across requirements, implementation, debugging, code review, testing and deployment in an Agile engineering team.

Frontend Engineer Intern · MAI Health

May – June 2024

Built React modules for patient portal workflows, appointments and health records. Integrated APIs, improved responsive layouts, and migrated application state to Redux Toolkit for more maintainable frontend modules.

Campus Ambassador · Cisco

August 2023 – July 2024

Connected the campus community with Cisco learning resources, certifications and technology events. Coordinated outreach and workshops, building experience in communication and community leadership.

Selected engineering work

Aditya Tripathi · Software Engineer

SCAMSHIELD · 2026

One interface for investigating suspicious emails, URLs, audio and AI prompts. Specialist analysis converges into a risk score and an explanation.

A Next.js interface connects to a Python FastAPI backend with separate processors for email, URL, audio and prompt analysis. Hugging Face models and Librosa support classification and spectral audio analysis; Ollama provides local LLM explanations. Redis coordinates processing, while MongoDB retains scan reports and history.

Technology: Next.js, TypeScript, FastAPI, Python, MongoDB, Redis, Hugging Face, Librosa, Ollama

github.com/aditya04tripathi/ScamShield

VAPOR VAULT · 2026

Temporary file sharing with a complete lifecycle: upload, storage, processing, access and scheduled deletion.

A modular NestJS API uses PostgreSQL and Prisma for file and job metadata, SeaweedFS for object storage, and Redis with BullMQ for asynchronous processing. The direct upload flow sends file bytes to storage before the API completes metadata registration. Workers persist processing checkpoints, and an hourly cleanup task removes files older than 24 hours from storage and the database. Docker supports reproducible deployment.

Technology: NestJS, TypeScript, PostgreSQL, Prisma, SeaweedFS, Redis, BullMQ, Docker

github.com/aditya04tripathi/vapourvault

DEVEVENT · 2025

A connected path from discovering a developer event to booking a place, receiving a QR ticket and checking in.

A pnpm monorepo separates the Next.js 16 frontend from a NestJS API. MongoDB stores events, users and bookings; MinIO handles media storage. API queries support search, tags, filters and pagination. Booking services generate QR tickets, validate their event and attendee data, and record check-in. GitHub Actions builds Docker images for deployment, with Railway configuration also maintained in the repository.

Technology: Next.js, React, TypeScript, NestJS, MongoDB, MinIO, QR codes, Docker, GitHub Actions

github.com/aditya04tripathi/dev-event

GNOSIS AI · 2025

Turn a startup idea into a validation report, an execution plan, an interactive flowchart and a SCRUM board.

A modular Next.js and TypeScript application integrates Groq for LLM inference, NextAuth.js for authentication and MongoDB through Mongoose for stored reports and project history. Validation results feed project planning, React Flow diagrams and SCRUM boards. Protected routes, usage tracking and access limits manage the AI workflow; the repository also supports an optional local Ollama provider.

Technology: Next.js, React, TypeScript, Groq, React Flow, NextAuth.js, MongoDB, Mongoose, Tailwind CSS, shadcn/ui

EDUCATION

Monash University

Bachelor of Engineering (Honours) – Software Engineering

February 2025 – 2027 (expected)

Amity University

Diploma in Computer Science Engineering

September 2022 – July 2024

Manav Rachna
